Press release

LYYN signs licence agreement with Emwitech

What's happening over there in the mist? Who's approaching under cover of the snowstorm? What's actually occurring in the half-light? Good visibility is decisive in the security industry. With LYYN's patent pending V.E.T. (Visibility Enhancement Technology), visibility in poor weather conditions can be radically improved.

Emwitech is an innovative company with two major strengths, one in radio technology and one in minute but advanced cameras that Emwitech combine in an advanced wireless camera at a very competitive price. With LYYN V.E.T. integrated in the camera the market gets access to a sturdy platform with a variety of different applications including alarm security and surveillance.

"This is not just business that has large potential in itself, we see it as an important piece in the jigsaw in customer discussions we are currently holding. The camera solution is the answer to many different requirements within fixed, mobile and personal applications." says Fredrik Beckman, Marketing Director LYYN.

"Emiwtechs business concept is to be an OEM supplier of technology in several areas including surveillance and alarm. One of the largest problems in this industry today is that it is difficult to extract the relevant information from a growing information flow. Now we have the possibility to offer one of the market's sharpest and most exciting tools for alarms via image. Our co-operation opens doors for using camera technology in completely new places and situations where it was previously impossible." says Johan Sedelius Hörberg, CEO Emwitech.

About LYYN:

LYYN is an R&D company working with image enhancement for improving visibility in different industries. Behind the company's technology lies many years of research in the human vision system and image technologies. LYYN offers a technical platform, V.E.T., for improving visibility in real time. The platform works with digital still images and video from common cameras, in real time, but also in post processing of stored material. V.E.T. improves visibility in for instance fog, haze, snow, rain, dust, darkness, etc. as well as in sub sea and medical applications. For examples please visit www.lyyn.com.
